

# Push Operation on Linked List :-

```
def push(head, data):  
    head = node(data, head)  
    return head
```

⇒ 1. start = None

start = push(start, 5) X

head = node( 5 , None )

return head

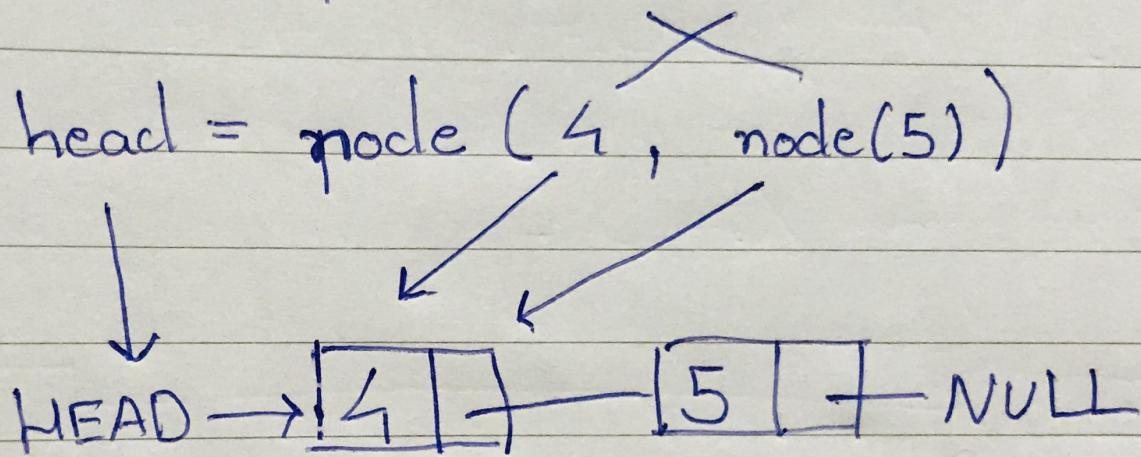

Now start = head ~~≠~~, node(5)

```
def node(self, data=None,  
        next=None):  
    self.data = data  
    self.next = next
```

return head

Now start = head ~~≠~~, node(5)

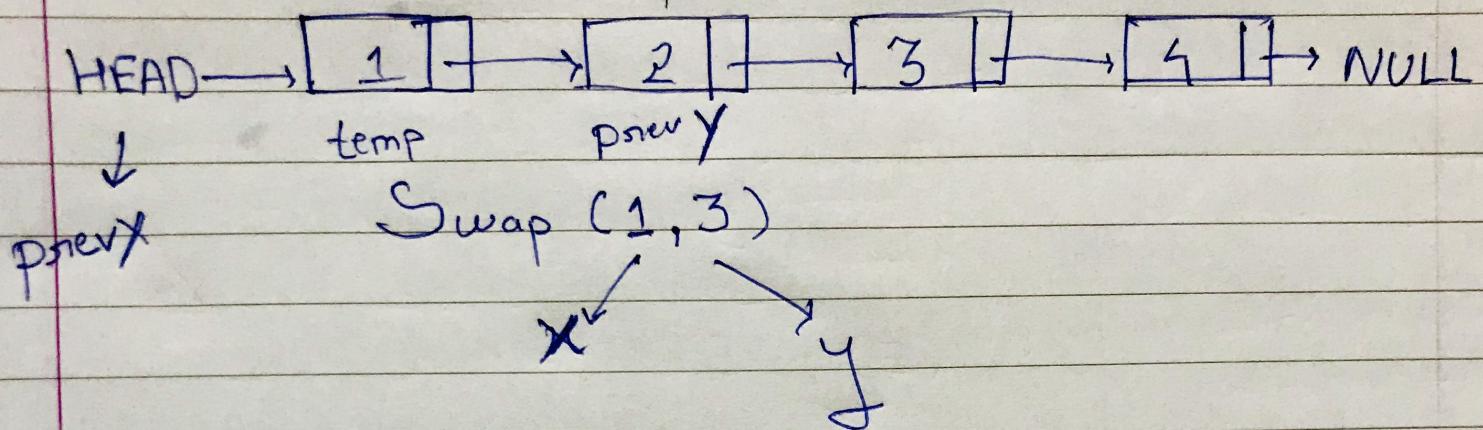

2. start = push(start, 4)

return head

Now, start = node(4)

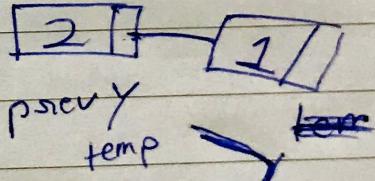

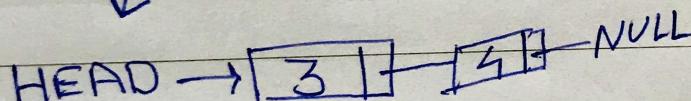

# Simple approach for Swap :-

1)  $\text{temp} = \text{prevX}.\text{next}$

$\text{prevX}.\text{next} = \text{prevY}.\text{next}$

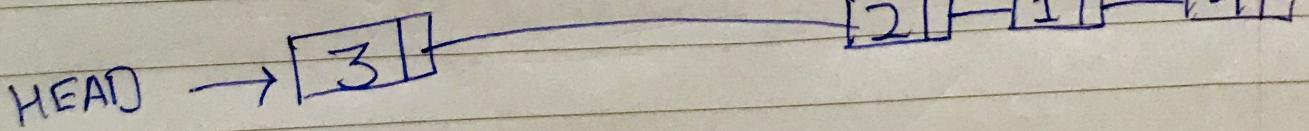

$\text{prevY}.\text{next} = \text{temp}$

2)  $\text{temp} = \text{prevX}.\text{next}.\text{next}$

$\text{prevX}.\text{next}.\text{next} = \text{prevY}.\text{next}.\text{next}$

$\text{prevY}.\text{next}.\text{next} = \text{temp}$

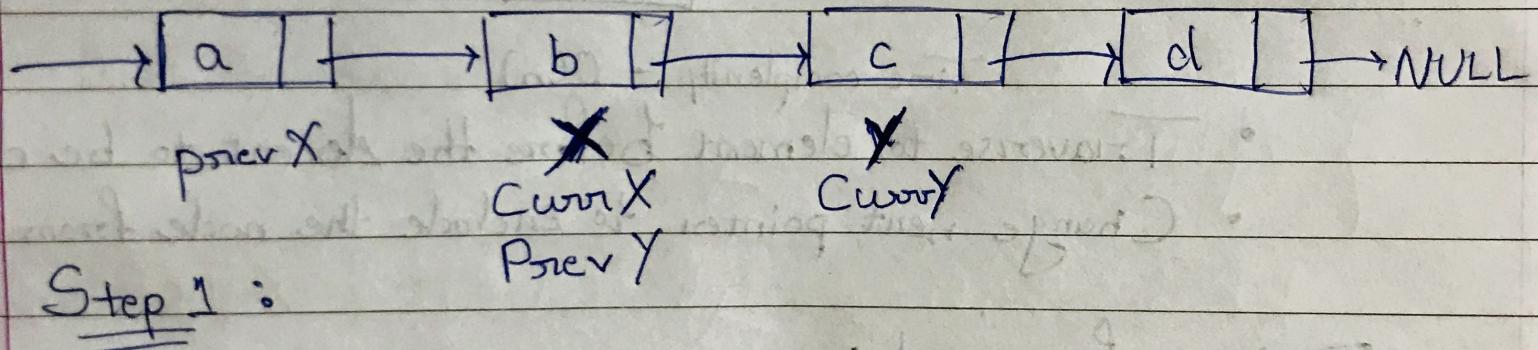

Problems :-

## Single Linked List

Swap Nodes of a Linked List :-

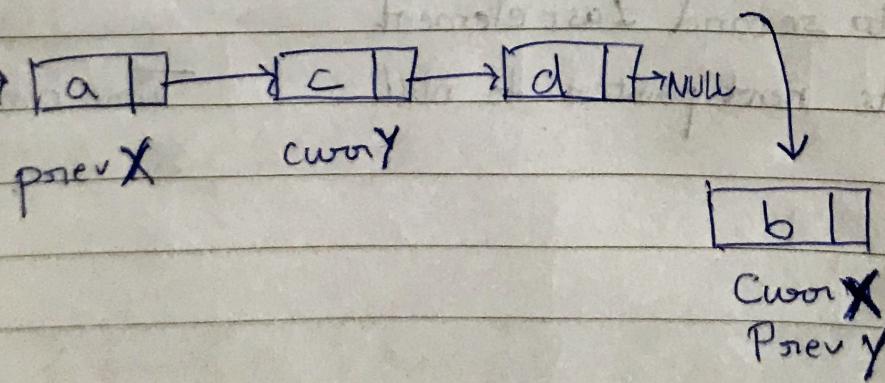

I. If X and Y both Not head

Step 1 :

$pprevX.next = currY \rightarrow$  for  $\times$  is not head

$pprevY.next = currX \rightarrow$  for  $\times$  is not head

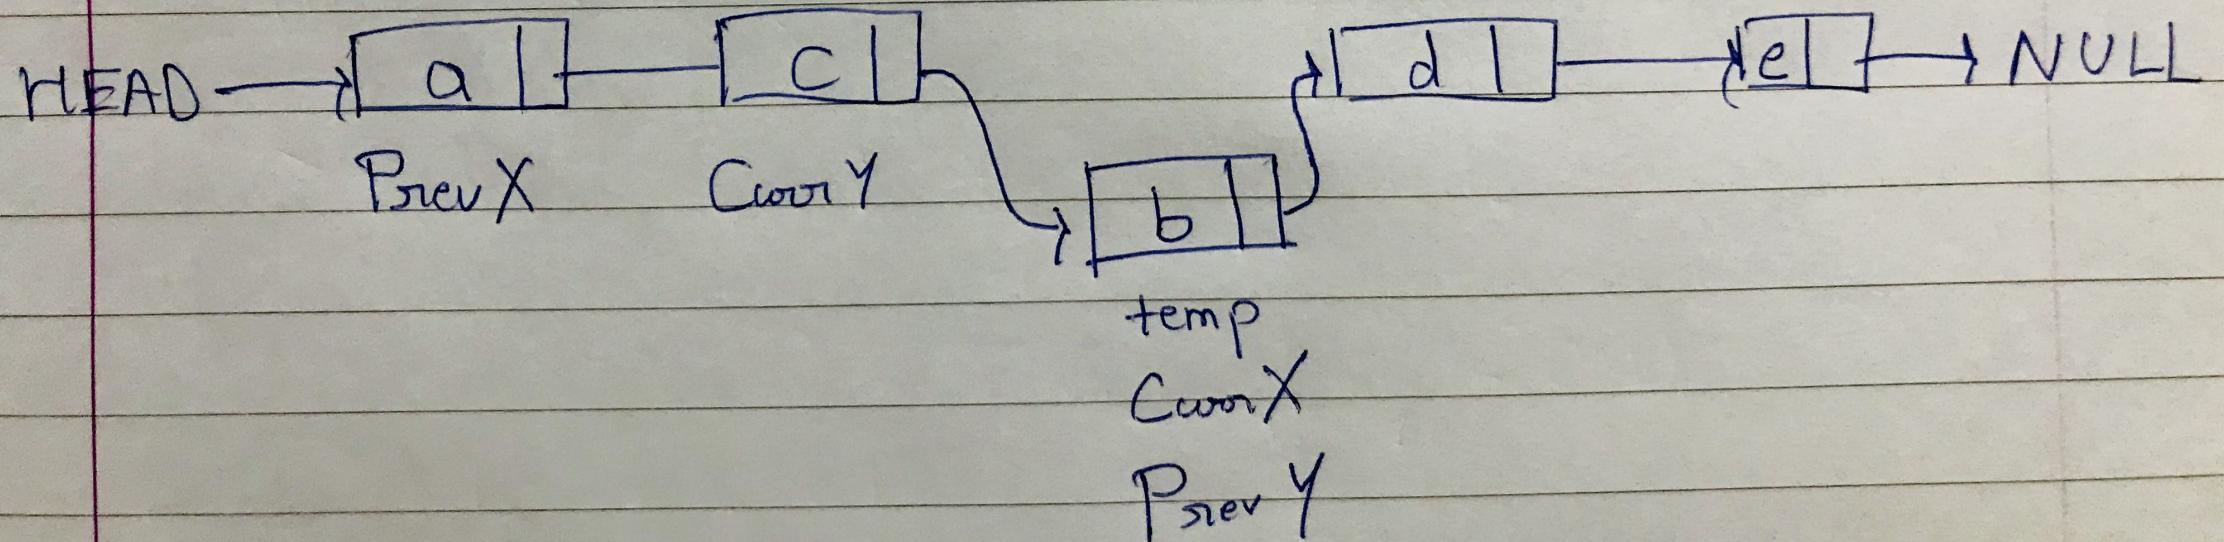

Step 2 :-

$\text{temp} = \text{CurorX.nent}$

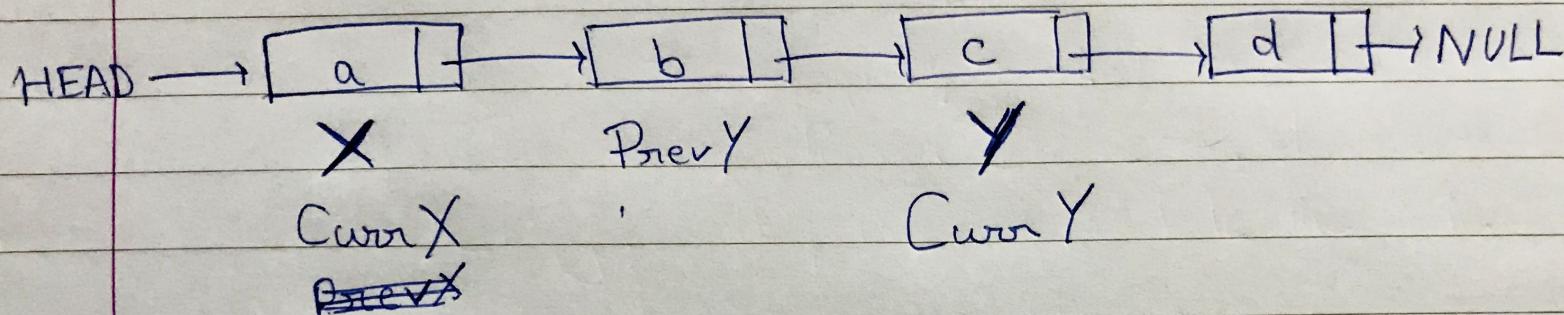

$\text{CurorX.nent} = \text{CurorY.nent}$

$\text{CurorY.nent} = \text{temp}$

Condition II :-

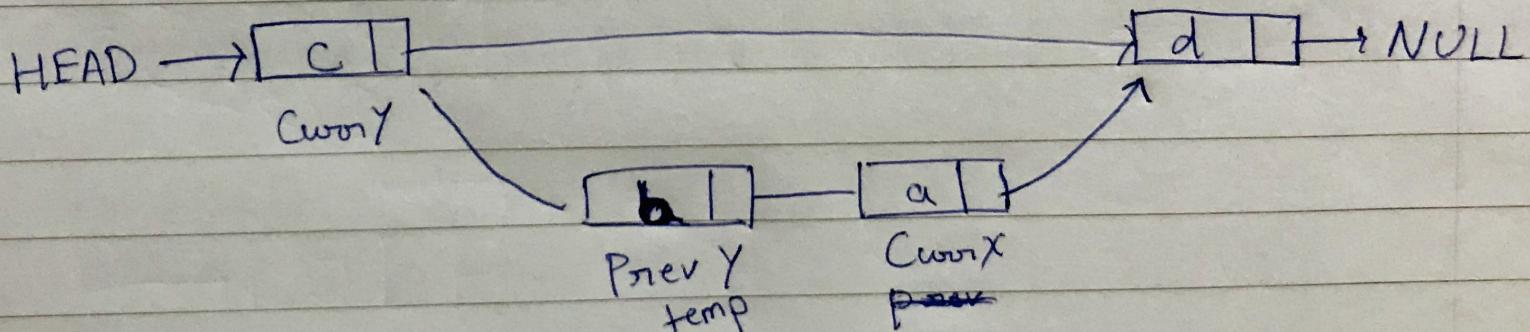

One is head Node ( $X$  or  $Y$ )

Step 1 :-

Self. head = Cur Y  $\rightarrow$  for  $X$  is head  
Make  $Y$  as head

prev Y. next = Cur X  $\rightarrow$  for  $Y$  not head

Step - 2 :-

$temp = Cur X \cdot next$

$Cur X \cdot next = Cur Y \cdot next$

$Cur Y \cdot next = temp$
